Born 1996.09.09

Backend engineer with eight years of experience, now on the 24/7 on-call trading team of a regulated Japanese crypto asset exchange, where correctness and uptime come first. I started the team's move to agent-driven engineering and proposed how agent-written work gets verified before review. I run my own projects the same way, and build the Rust tooling that gives agents memory across sessions.

EXPERIENCE

OKCoin Japan K.K. (OKJ) 2023.08 – Present
Backend Engineer, Trading Team

- Develop features in Java and Spring across the trading platform: order handling, matching, market data, real-time push and the other core trading services. The team expects every member to cover any of them.
- Built spot price monitoring in the market services, consolidating prices into a reference price the rest of the platform reuses.
- Built an Agrona-style processor that streams database changes from Kafka (MySQL binlog via Canal) into Redshift, handling buffering, concurrency, Kafka offset correctness, retries and atomic loads.
- Started the team's move to agent-driven engineering: built its knowledge base on how our systems work; runbooks for research, plans, reviews, audits and incidents; and agent skills for the daily workflows. As agent-written changes grew, review became the bottleneck, so I proposed proof of effort: every merge request would tie its claims to reproducible checks before anyone reviews it.
- On the 24/7 on-call rotation for the whole trading platform, handling production incidents across all of its core services, including recovering a failed cluster node.
- In the platform's containerization and move to Amazon EKS, led by the tech lead, designed and built its Kubernetes deployment layer: a cdk8s construct library and an Argo CD repository of ApplicationSets, projects and per-environment overlays, delivered through a self-hosted Argo CD. Colleagues now reuse it to add new services.
- Share Kubernetes operations with the SRE team, covering the trading team's services: CVE patching and cluster and component upgrades.
- Building a Kubernetes operator and its CRDs for running test cases: developers and QA describe a test case as a custom resource, and the operator runs it, records the outcome in the resource's status, stores a run summary in S3 and reports to the internal test platform.
- Present regularly at the team's weekly technical sessions: the systems we operate, computer science fundamentals and LLMs.

iFLYTEK Co., Ltd 2021.01 – 2023.08
Backend Engineer, Audio & Video Research Team

- Owned the server-side Java SDK that let customers' servers join calls as clients; one process can simulate hundreds of clients within seconds.
- Contributed features to the signaling service that sets up every call, designed by the tech lead: peer-to-peer connections, group chats and multi-party meetings.
- Owned the client logging system on the ELK stack, used to analyze RTC call quality: problems that only happened on users' devices could be searched and diagnosed from one console, next to metrics and signaling events.
- Built the gateway that connects WeChat Mini Program clients, which cannot speak the platform's media protocol, to the platform.
- For customer delivery, which paired other teams' desktop and mobile SDKs with an installable backend, packaged the Java SDK, the logging stack and the other Java services with the backend into one Kubernetes bundle built on Sealos.

Hefei Dingfeng Digital Technology Co., Ltd 2019.01 – 2020.12
Backend Engineer

- Added features to a content management system for a financial firm, across the Java backend and the JSP front end.

Foxconn 2018.07 – 2018.12
Graduate Trainee

- Rotated through server manufacturing in Shenzhen, from motherboard production to fully integrated rack-scale server systems.

PROJECTS

cappuccino Kotlin · Swift · Rust
Native iPhone and Android app for the coding agents already running on my machines: read each conversation, send prompts, stop runs and answer approvals from the phone, through a Rust bridge reached peer-to-peer over iroh.

asobi Rust
Knowledge-graph CLI and server, published on crates.io, that lets agents pick up tasks, decisions and known pitfalls across sessions and machines instead of rediscovering them.

iroha Go · Svelte
Personal data cockpit that imports my location, activity, sleep and expense history into Postgres and PostGIS, with a sanitized public archive kept apart from the private API.

harus-aeron-rs Rust · WIP
Agent-driven practice project: agents reimplement Aeron in Rust under a file-by-file parity ledger against upstream, gated by an interop soak between the real Java client and the Rust media driver.

SKILLS

Programming	Java, Rust, Go, TypeScript
Backend	Spring Boot, Netty, gRPC, Kafka, Aeron, MySQL, Redis, ELK
Infrastructure	AWS (CDK, EKS), Kubernetes (cdk8s, Argo CD), Nix, Prometheus, Grafana
Certification	AWS Certified Solutions Architect – Professional
Languages spoken	Chinese (Native), Japanese (JLPT N1, 2017), English (IELTS 6.5, 2019)
Education	B.Sc. Information Management and Information System, Changsha University of Science and Technology (2014.09 – 2018.06)
