Born 1996.09.09

Backend engineer with seven years of experience, now on the 24/7 on-call trading team of a regulated Japanese crypto asset exchange, where correctness and uptime come first. I led the team's move to agent-driven engineering and proposed how agent-written work gets verified before review. I run my own projects the same way, and build the Rust tooling that gives agents memory and code intelligence.

EXPERIENCE

OKCoin Japan K.K. (OKJ) 2023.08 – Present
Backend Engineer, Trading Team

- Led the team's move to agent-driven engineering: built the team's knowledge base on how our systems work, with reviewed narratives, runbooks for research, plans, reviews, audits and incidents, and agent skills for the daily workflows. When agent-written changes piled up in the tech lead's approval queue, proposed proof of effort: every merge request ties its claims to reproducible checks before anyone reviews it.
- On the 24/7 on-call rotation for the order and matching core: handled its production incidents, including recovering a failed node of its consensus cluster.
- Designed and built the Kubernetes deployment layer for the platform's move to Amazon EKS, led by the tech lead: a cdk8s construct library and an Argo CD repository of ApplicationSets, projects and per-environment overlays, which colleagues now reuse to add new services, delivered through a self-hosted Argo CD. Helped take it to production.
- Run the platform's Kubernetes operations: CVE patching, cluster and component upgrades, and Kubernetes operators for internal systems.
- Present regularly at the team's weekly technical sessions: the systems we operate, computer science fundamentals and LLMs.

iFLYTEK Co., Ltd 2021.01 – 2023.08
Backend Engineer, Audio & Video Research Team

- Wrote the server-side SDK that let users run the platform from their own servers; one process can stand in for hundreds of clients.
- Helped implement the signaling service, led by the tech lead, that sets up every call: peer-to-peer connections, group chats and multi-party meetings.
- Built the client logging system, so problems that only happened on users' devices could be searched and diagnosed from one console, next to metrics and signaling events.
- Connected WeChat Mini Program clients, which cannot speak the platform's media protocol, through a dedicated gateway.
- Turned the research platform into a shippable product: SDKs plus an installable infrastructure bundle.

Hefei Dingfeng Digital Technology Co., Ltd 2019.01 – 2020.12
Backend Engineer

- Developed a financial content management system end to end, from the Java backend to the JSP front end.

AGENT-DRIVEN ENGINEERING

Multi-repository agent workstation private
One working tree over my repositories, adapted from the knowledge base I built at work, so an agent sees a job that spans several repositories as one context. Claude Code, Codex and pi agents follow a written contract: tiered process, playbooks, decision records, local gates before every commit, and pushes only with my approval.

ochna Rust
Indexes Rust, Go, Java, C, C++ and Zig code into a symbol and call graph, so agents can answer "who calls this?" without reading whole files.

asobi Rust
Knowledge-graph CLI and server that lets agents pick up tasks, decisions and known pitfalls across sessions and machines instead of rediscovering them.

SYSTEMS & INFRASTRUCTURE

harus-aeron-rs private · Rust
Reimplementation of Aeron's media driver, Archive and Cluster foundations, written to learn the messaging layer my trading work runs on; a real Java Aeron client exchanges ordered messages with the Rust media driver in an end-to-end interop test.

Homelab private
Single-node k3s cluster that runs my own services, with my machines provisioned from one Nix flake.

SKILLS

Programming	Java, Rust, Python, Go, TypeScript
Backend	Spring Boot, Netty, gRPC, Kafka, Aeron Cluster, MySQL, Redis, ELK
Infrastructure	AWS (CDK, EKS), Kubernetes (cdk8s, Argo CD), Nix, Prometheus, Grafana
Agents	Claude Code, Codex, pi; instructions, skills, delegation and review workflows
Certification	AWS Certified Solutions Architect – Professional
Languages spoken	Chinese (native), Japanese (JLPT N1), English
Education	B.Sc. Information Management and Information System, Changsha University of Science and Technology (2014.09 – 2018.06)
